

Sub B1  
A 12 (concluded)

a plurality of logic circuits having either one of the same functions and different functions being mounted in each of said active regions, and  
a selection circuit for selectively operating only one of said plurality of mounted logic circuits.

2. (Amended) The semiconductor device comprising:  
an I/O region formed on a chip and having at least an input/output pad;  
an active region formed on said chip;  
a plurality of logic circuits having either one of the same functions and different functions being mounted in said active region, and  
a selection circuit for selectively operating only one of said plurality of mounted logic circuits;  
wherein said selection circuit includes a disconnecting section, and  
said disconnecting section is disconnected to allow permanent setting of an operable circuit.

Sub B1  
A 13

4. (Amended) The semiconductor device according to claim 1, wherein said selection circuit selects a logic circuit to be operated on a basis of a signal input supplied from an outside through said input/output pad.

5. (Amended) The semiconductor device comprising:  
an I/O region formed on a chip and having at least an input/output pad;  
an active region formed on said chip;  
a plurality of logic circuits having either one of the same functions and different functions being mounted in said active region, and  
a selection circuit for selectively operating only one of said plurality of mounted logic circuits;

Sub  
131  
A13  
(concluded)

U.S. Application No.: 10/073,134

Atty. Docket No. 09792909.5338

wherein said selection circuit includes a transistor element connected in series with each said logic circuit between said logic circuit and a power terminal, and  
said transistor element selects a logic circuit to be operated on a basis of a signal input supplied from an outside through said input/output pad.

A14

Please delete the present Abstract of the Disclosure and replace it with the following new

**Abstract of the Disclosure:**

A semiconductor device includes on the same chip at least an I/O region where an input/output pad is formed and active regions where a circuit can be mounted, where a plurality of logic circuits having the same functions or different functions are mounted in the active regions on the same chip.
